

**Professional Strength,
Natural Cleaning with**

InVade™ **technology**

The presence of moisture and organic matter creates special challenges for sanitation in commercial facilities. If left unaddressed, it can result in nuisance at best, and threats to health and safety at worst. Food prep areas, garbage areas, and communal shower areas in facilities such as health clubs are some of the primary problem spots.

Manual removal of organic waste such as wash down and wet mopping can only go so far. Manual cleaning tends to push food or other organic matter and moisture into cracks and crevices. When enough build up occurs problems can arise.

There's a more effective way to manage sanitation in a commercial facility and mitigate the problems associated with poor sanitation.

Sanitation can be addressed most effectively and in a "green" manner with the professional strength InVade™ range of microbial cleaners applied and sold by your Service Professional.

InVade Technology at a Glance

- Your Service Professional may apply a special foam as a single clean out or on a monthly basis to the drains and other areas where organic buildup is the worst. These areas can include soda or beer fountains, the cracks between baseboards and floors and walls, cracks in floor tile, or other cracks around processing machinery. Your Service Professional is trained to identify these areas where organic build up occurs.
- Your Service Professional may also place InVade Bio Bullets™ in your drains or other areas. These slow dissolving microbial blocks will treat organic build up all month long.
- Other formulations are also available for use directly by your staff. Your Service Professional may recommend InVade Bio Drain™ which is a gelled formula that is applied in the drains 1-3 times a week.
- InVade Bio Cleaner™ is also available for general cleaning, spraying and mopping, indoors and out. It is used instead of your regular mopping or power spraying solution and provides exceptional cleaning and degreasing action.
- InVade HotSpot™ is a handy aerosol foam for spraying on messes big or small. Spray it on and let the microbes do the work.

An Effective Natural Clean

InVade products utilize natural, probiotic soil microbe spores to digest scum and eliminate odors. The spores are activated when they come in contact with their food (the scum). These microbes act as ‘enzyme factories’ that digest organic matter. The microbes produce enzymes as long as moisture and their food source are available. The by-products of digestion are carbon dioxide and water vapor, the same things humans and animals exhale. Any inorganic components of the scum may also remain as a fine ash (similar to when something is burned) which can easily be washed up. This probiotic process is the same as what goes on in the digestive system of humans and animals, and also in soil composting. InVade cleans the way nature cleans.

InVade products contain premium microbes in spore form that resist chemical attack. However, results with the products will be best if bleach, ammonia or other products labeled as ‘disinfectants’ or ‘anti-bacterial’ are not used in the same areas.
